

Dry Gas Seal Management Program

Dry Gas Seals are critically engineered components which need to be stored properly to ensure they operate at an optimal level when installed.

With John Crane's Dry Gas Seal Management Program, we eliminate normal repair cycle times and ensure your spare seals are ready for shipment when needed. Reducing the time from weeks to hours ensures your equipment is back up and running with minimal disruption.

- **Management and monitoring services for dry gas seals, to avoid unplanned costs and downtime**
- **Pro-active, scheduled health checks and testing, enabling on-demand seal availability**
- **Secure, humidity- and temperature-controlled facilities to ensure optimal seal storage**

Maintaining Dry Gas Seals

Maintaining dry gas seals in the field can be a difficult task. Varying environmental factors and incorrect storage practices can dramatically reduce seal life, compromising the reliability and availability of rotating equipment.

As part of our growing customer reliability partnership strategy we have developed the **Dry Gas Seal Management Program** to take the guess work out of seal storage, creating a controlled environment to preserve, maintain and manage the integrity of your dry gas seals.

The program includes:

- Secure, climate-controlled storage rooms
- Seals stored in customized flight boxes
- Rapid turnaround from customer request to seal shipment
- Static and dynamic testing
- Recertification and warranty of seals to like new conditions

Together, we will work with you to keep your mission-critical operations up and running, with support and guidance from our experienced team.
