**Product Description**

- **Type 1604 HTC** - Single stationary bellows cartridge seal
  Type C, Arrangement 1
- **Type 2609 HTC** - Dual unpressurized rotating bellows cartridge seal Type C, Arrangement 2
- **Type 3609 HTC** - Dual pressurized rotating bellows cartridge seal Type C, Arrangement 3

These dependable API 682 cartridge seals utilize two impressive design innovations by incorporating high-temperature corrosion resistant sealing (HTC) and unique high-temperature live-loaded (HTL) mating ring technology in dual seal arrangements. This new design vastly enhances seal face stability over conventional designs and can extend mean time between repair (MTBR) in many services.

**Exceptional Face Stability**

The HTC primary seals, patent pending, incorporate specially designed pressure compensating seal faces and thermally compliant components that provide superior seal face stability at elevated temperatures. With advanced HTL mating ring design, patent pending, seal face stability is achieved by eliminating any thermal and mechanical forces that can contribute to seal face distortion. The sealing interface remains exceptionally stable in spite of thermal changes and adapts to the wide range of temperature excursions inherent in high-temperature applications.

**Corrosion Resistance**

These all-Inconel® seals are ideally suited for applications that contain organic acids (naphthenic acids) and sulfur compounds that attack most other alloys at high temperatures.

---

**Performance Capabilities**

- **Temperature:** $-100^\circ F$ to $800^\circ F$/$-75^\circ C$ to $425^\circ C$
- **Pressure:** vacuum to 300 psi(g)/20 bar(g)
- **Speed:**
  - Type 1604 HTC: up to 10,000 fpm/50 m/s
  - Type 2609 HTC/3609 HTC: up to 5000 fpm/25 m/s
- **Shaft size:** 1.5” to 4.5’/30mm to 120mm

---

**Design Features**

- **API 682 qualified**
- **HTC technology**
- **HTL mating ring technology provides exceptional face stability**
- **Sealide-C® advanced silicon carbide composite**
- **ID and OD pressure capability — withstands reverse pressurization (Type 2609 HTC/3609 HTC)**
- **All-Inconel metallurgy — meets NACE MR0175/MR0103**
- **Dual scroll pumping device standard**
- **Optional segmented spring-loaded carbon throttle bushing for effective containment (Type 1604 HTC)**
- **Retained mating ring available for vacuum service (Type 1604 HTC)**
**Typical Type 1604HTC API Type C Arrangement 1 - Single Cartridge**

A single stationary Type 1604HTC seal that contains a steam guide (steam deflector or anti-coking baffle) which directs steam to the area where coke would tend to form and routes the steam to carry material away from the seal and seal faces.

**Typical Type 2609HTC/3609HTC API Type C Arrangements 2 and 3 - Dual Cartridge**

A dual seal with a Type 609HTC inner seal and Type 609 outer seal. Typically used with API Plan 52 or 53A/B/C.
Typical Type 2609HTC/3609HTC API Type C Arrangements 2 and 3 - Dual Cartridge

A dual seal with a Type 609HTC inner seal and 609HTC outer seal. Typically used with API Plan 52 or 53A/B/C.

A dual seal arrangement with a diverter (option). Type 609HTC inner seal with a Type 609 outer seal. Typically used with API Plan 54.

A dual seal arrangement with a diverter (option). Type 609HTC inner seal with a Type 609HTC outer seal. Typically used with API Plan 54.
The basic pressure rating is for a standard seal, as shown in the typical arrangement, when installed according to the criteria given in this data sheet and generally accepted industrial practices.

The basic pressure rating assumes stable operation at 3600 rpm in clean, cool, lubricating non-volatile liquid with an adequate flush rate. When used with the multiplier factors, the basic pressure rating can be adjusted to provide a conservative estimate of the dynamic pressure rating.

Contact John Crane for process services outside this range for a more specific assessment of the dynamic pressure rating.

### Multiplier Factors

</table>

*The ratio of sealed pressure to vapor pressure must be greater than 1.5, otherwise consult John Crane. If the specific gravity is less than 0.60, consult John Crane.

**NOTES:**
1. Specific gravity ≥0.6 and ratio of sealed pressure to vapor pressure >1.5.
2. More details regarding the fluid and the operating conditions are required.
3. Temperature at the seal faces includes effects of flush, quench and cooling.
4. Contact John Crane for more information.

**Example for Determining Dynamic Pressure Rating:**
The maximum pressure for a particular application is the lesser of the maximum pressure limit curve or the pressure calculated when the multiplier factors are applied to the specific seal face material curve.

Maximum pressure limit curve:
283 psi(g)/19.5 bar(g) max. pressure

Hard face limit curve: 406 psi(g)/28 bar(g)

Calculated limit:
406 psi(g)/28 bar(g) x 1.00 x 1.00 = 406 psi(g)/28 bar(g).

At 3600 rpm with the service conditions noted, an 3.5”/89mm Type 1604HTC has a maximum operating OD pressure limit of 283 psi(g)/19.5 bar(g).

HTL Mating Ring Technology

HTL technology utilizes a specially shaped mating ring, compression ring, and energized Z-Spring to “live-load” the secondary flexible graphite packing and to control any radial and axial forces that may be imparted to the mating ring. By utilizing components with similar coefficients of thermal expansion and by eliminating contact with metal surfaces, the HTL mating ring design minimizes and/or eliminates face distortion due to the relative differences in the thermal growth between components and by eliminating contact with metal surfaces. There are no forces transferred from the gland to the mating ring ensuring face stability and face flatness.

The mating ring has dual pressure capability which enables it to operate dependably with either a higher pressure process or barrier liquid at the outside or inside diameter location.

HTC Technology

The HTC seal provides an effective solution in sealing corrosive fluids at elevated temperatures by utilizing a complete all-Inconel metallurgy and unique face seal technology that provides exceptional stability across a wide range of pressure/temperature conditions.

An effective means of ensuring seal reliability is by controlling seal face distortion, which directly affects the operating conditions at the sealing surface. The HTC incorporates pressure compensating seal faces and thermally compliant components that ensure exceptional seal face flatness stability which resists any compromising effects from temperature and pressure. Such exceptional face stability can result in reduced leakage and longer seal life.

In dual seal arrangements, this rugged seal is capable of handling reverse pressurization. In a dual unpressurized bellows arrangement, the primary seal is designed to contain a buffer reverse pressure. In a pressurized dual seal arrangement, the primary seal is normally operating with reverse barrier pressure and is designed to contain the process pressure in the event of loss of barrier pressure.

The HTC has proven to be a superior design for high temperature, corrosive applications up to 800°F/425°C.
Sealide-C Advanced Silicon Carbide Composite Primary Ring

Sealide-C is a state-of-the-art, sintered silicon carbide with low friction and the inherent lubricity of free graphite. This silicon carbide is a tough, hard, heat resistant, long wearing, inert seal face material. When compared with other face materials, Sealide-C provides improved corrosion resistance, improved thermal shock resistance, and lower running face temperatures.

Sealol Welded Metal Bellows

Design Features:
- Optimum 45° tilt angle
- Three-sweep radius
- nesting ripple plate design
- static secondary seal
- light spring loads

Sealol Bellows Benefits:
- Uniform plate rigidity and stress distribution
- Enhanced fatigue strength
- Pressure-balanced by design
- Less heat
- Lower power consumption

Inconel

- Inconel 718 nickel-chromium iron alloy is excellent for use in corrosive environments at elevated temperatures.
- This heat-treatable alloy retains excellent mechanical properties over a wide temperature range. Alloy 718 is utilized for the bellows plates and unique shell design and is the highest strength bellows material available.
- Meets NACE MR0175/MR0103 requirements.

Recommendations for Viscous Fluids

0 - 3500 cSt: Hard face material
3500 - 10,500 cSt: Consult John Crane

NOTE: SSU (Saybolt Universal Seconds) approximately equals cSt (centistoke) x 4.6347 cP (centipoise) = cSt (centistoke) x specific gravity.

Typical Applications

- Hydrocarbons
- Aromatic fractionation products (benzene, toluene, solvents, etc.)
- Crude oil fractionation products (fuel oil, lubricating oil, gasoline, etc.)
- Chemicals, caustics, some acids, aqueous solutions, lubricating liquids
- Heat transfer fluids

Angular and Radial Movement

Excessive runout will have a detrimental effect on seal performance in the form of component wear or excessive leakage. API 682 limits runout as follows:
- Centering of the seal is to be by a register fit. The register fit surface shall be concentric to the shaft and have a total indicated runout (FIM) of not more than 0.005"/125 micrometers.
- Squareness of the seal chamber face to the shaft shall not exceed 0.0005" per inch of seal chamber bore (15 micrometers per cm).
- Runout of the sleeve outer diameter to the inner diameter shall be 0.001"/25 micrometers FIM.
- Shaft-to-sleeve diametrical clearance shall be 0.001" to 0.003"/25 to 75 micrometers.
If the products featured will be used in a potentially dangerous and/or hazardous process, your John Crane representative should be consulted prior to their selection and use. In the interest of continuous development, John Crane Companies reserve the right to alter designs and specifications without prior notice. It is dangerous to smoke while handling products made from PTFE. Old and new PTFE products must not be incinerated. ISO 9001 and ISO14001 Certified, details available on request.
